SOICT, HUST, 2021

1

Plan

- Introduction
- Digital images and basic operations
  - histogram, brightness, contrast, color, texture, …
- Convolution and Filters
  - noisy remove,
  - edge detectors
- Feature extraction: local and global descriptor

Computer Vision ?

- Image Processing
  - Work with image as a matrix
  - Input: image ➔ output: image
  - Help human to examine / modify images
- Computer Vision
  - Make computers understand images and video
  - Images and video are a source of information on the reality

What kind of scene?

Where are the cars?

How far is the building?

…

Computer Vision and Applications

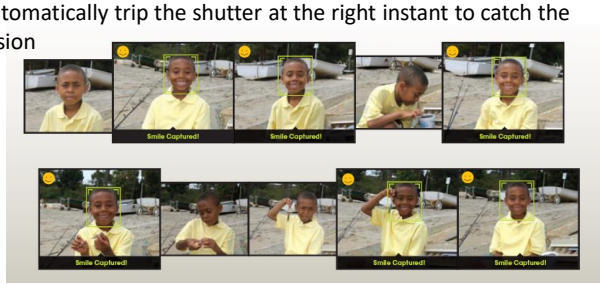
- Images, video are everywhere
- Video, images:
  - Riche information

➔Hot topic, especially When we talk every day about AI with smart city, mart home, smart …

Facebook's suggestion

Smile detection: smart camera

- Camera can automatically trip the shutter at the right instant to catch the perfect expression



Source: Derek Hoiem, Computer vision, CS 543 / ECE 549, University of Illinois

How vision is used now

- Login without a password, but with biometrics (fingerprint, iris, face,.

Fingerprint scanners on many new laptops, other devices

Face recognition systems now beginning to appear more widely

Robot vacuum cleaner

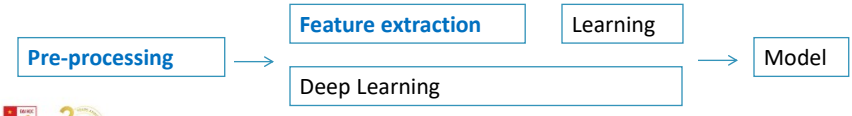
What we will talk about?

- 2 types information we would like to extract from images:
  - Matrix 3D information
  - Semantic Information

3D building?

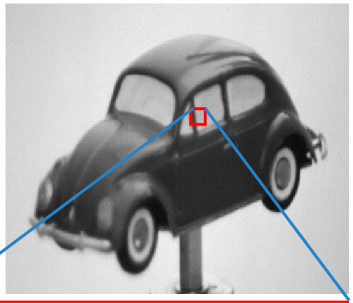
Where is it?
Text in the picture, what does it means?
Are there any person in the picture?

How to represent the image content ?



Digital images ?

- What we can see on the picture?
  - A car?
- What does the machine see?
  - Image is a matrix of pixels
  - Image N x M : N xM matrix
  - 1 pixel (gray levels):
    - An intensity value: 0-255
    - Black: 0
    - White: 255



64	60	69	100	149	151	176	182	179
65	62	68	97	145	148	175	183	181
65	66	70	95	142	146	176	185	184
66	66	68	90	135	140	172	184	184

Digital images ?

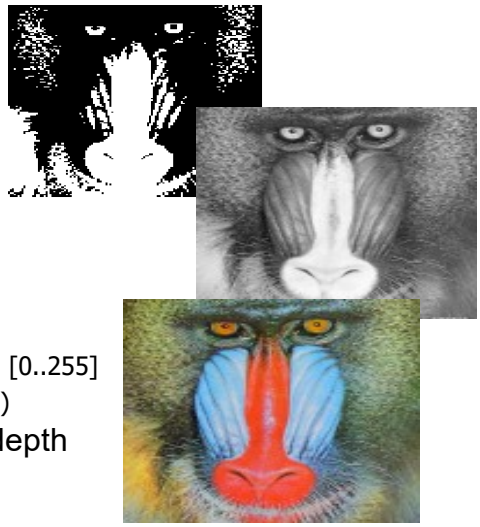
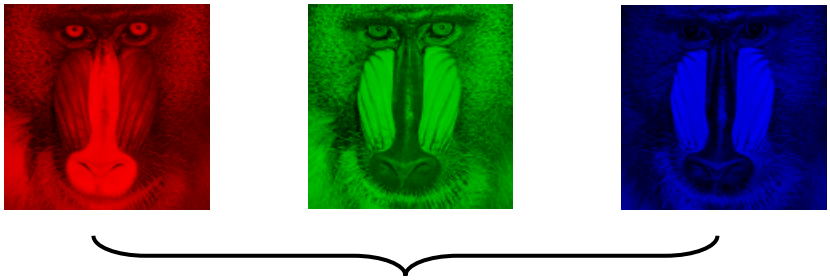
- Principal type of images
  - Binary image:
    - $I(x,y) \in \{0, 1\}$
    - 1 pixel: 1 bit
  - Gray image:
    - $I(x,y) \in [0..255]$
    - 1 pixel: 8 bits (1 byte)
  - Color image
    - $I_R(x,y)$, $I_G(x,y)$ $I_B(x,y) \in [0..255]$
    - 1 pixel: 24 bits (3 bytes)
  - Other : multi-spectre, depth image,…



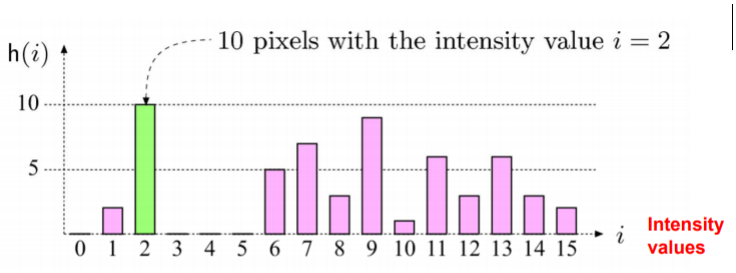
Color image in RGB space



It exists other color spaces: Lab, HSV, …

Image histogram

- Histogram is a graphical representation of the repartition of colours among the pixels of a numeric image.



i	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
h(i)	0	2	10	0	0	0	5	7	3	9	1	6	3	6	3	2

Image histogram

- Histogram
  - Should be normalized by dividing all elements to total number of pixels in the image

$p(i) \epsilon [0,1]$

$\sum_{i=0}^{255} p(i) = 1$

Image dynamic range = [min_value, max_value]

Image histogram

- Histogram
  - Only statistic information
  - No indication about the location of pixel (no spatial information) ➔ Different images can have the same histogram

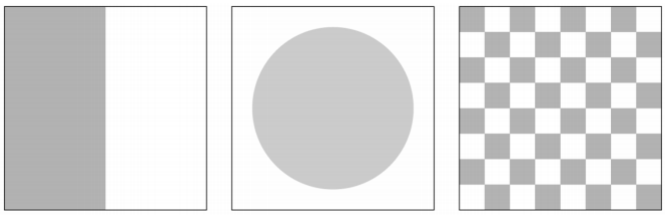


Image Brightness

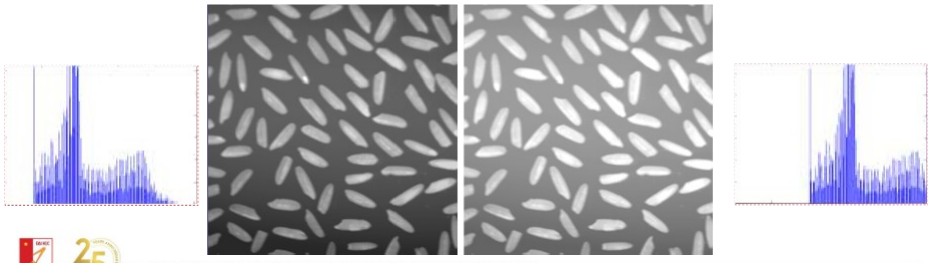
- Brightness of a grayscale image is the average intensity of all pixels in an image
  - refers to the overall lightness or darkness of the image

$$B(I) = \frac{1}{wh}\sum_{v=1}^{h}\sum_{u=1}^{w} I(u,v)$$

Divide by total number of pixels

Sum up all pixel intensities



Contrast

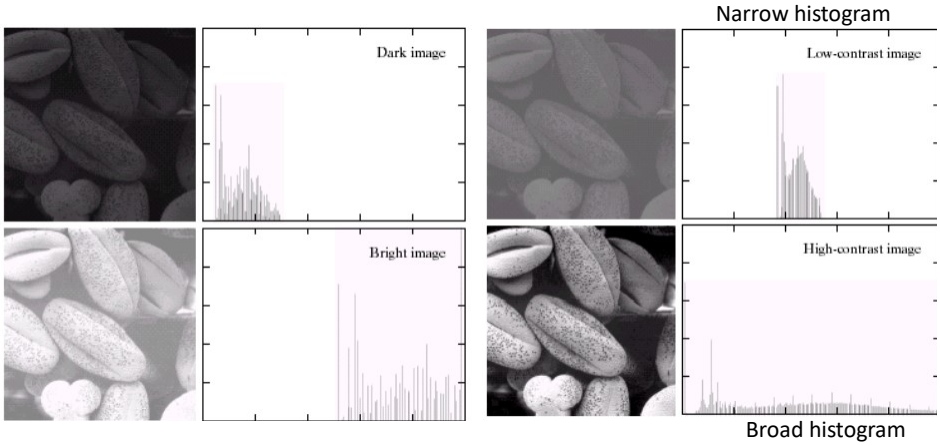
- The contrast of a grayscale image indicate how easily object in the image can be distinguished
- Many different equations for contrast exist
  - Standard deviation of intensity values of pixels in the image

$$C = \sqrt{\frac{1}{M \times N}\sum_{x=0}^{N-1}\sum_{y=0}^{M-1}(f(x,y)-Moy)^2}$$

  - Difference between intensity value maximum et minimum

$$C = \frac{\max[f(x,y)] - \min[f(x,y)]}{\max[f(x,y)] + \min[f(x,y)]}$$

Brightness/Contrast vs histogram



Contrast Enhancement

- Modify pixel intensities to obtain higher contrast
- There are several methods:
  - Linear stretching of intensity range:
    - Linear transform
    - Linear transform with saturation
    - Piecewise linear transform
  - Non-linear transform (Gama correction)
  - Histogram equalization (Cân bằng histogram)

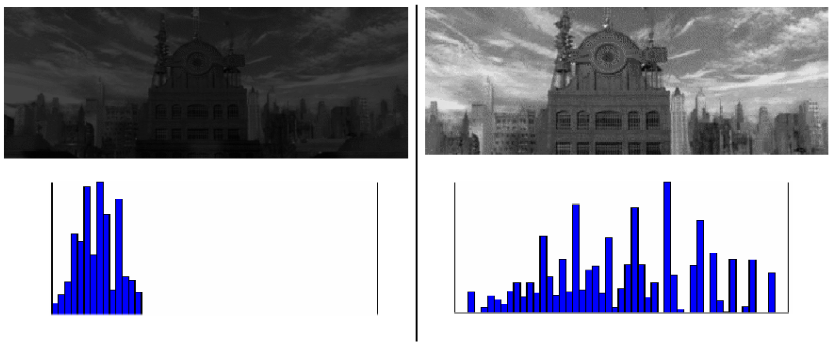
Linear stretching

$$s = s_{min} + (r - r_{min})\frac{s_{max} - s_{min}}{r_{max} - r_{min}}$$

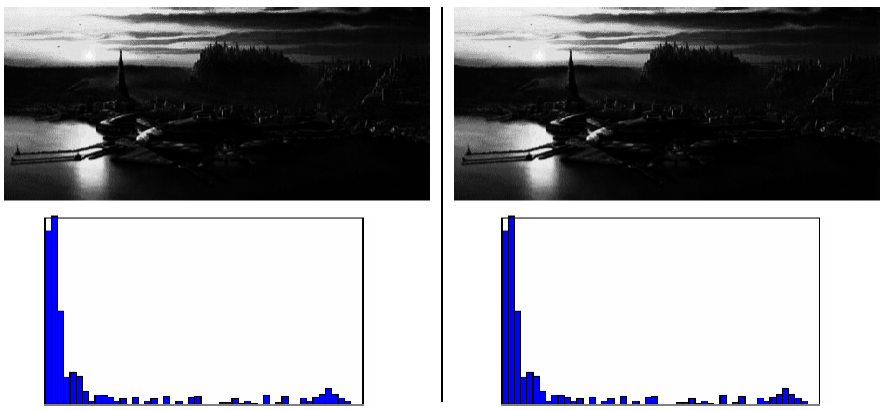
$$s = a.r + (s_{min} - a.r_{min}),$$
where a = $\frac{s_{max} - s_{min}}{r_{max} - r_{min}}$

If $s_{min} = 0;\ s_{max} = 255$

$$s = (r - r_{min})\frac{255}{r_{max} - r_{min}}$$



Linear stretching

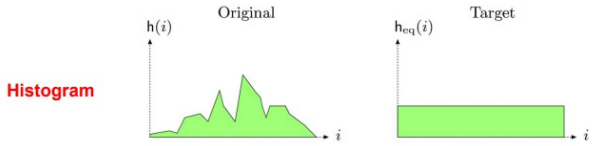


Intensity range = [0,255]

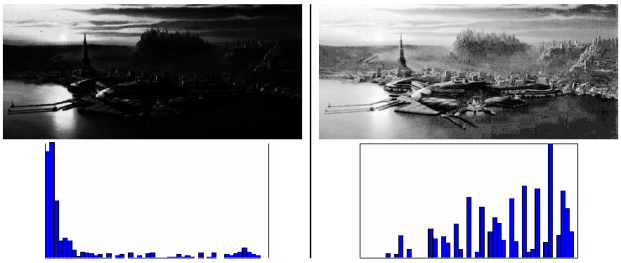
No efficace?

Histogram equalization

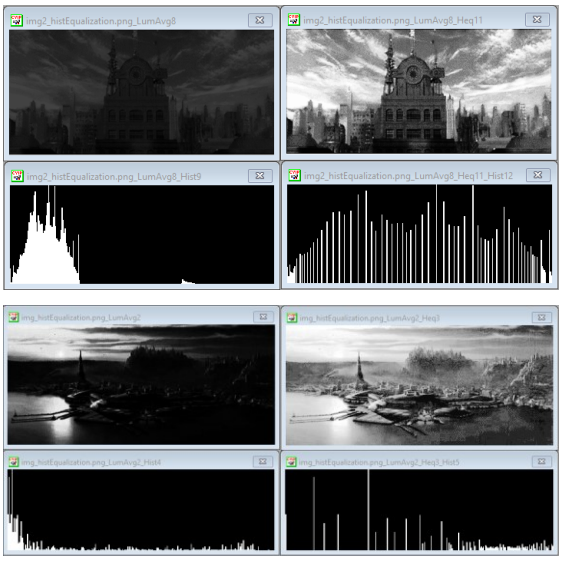
- Change histogram of modified image into uniform distribution



- No parameters. OpenCV:cv2.equalizeHist(img)



Histogram equalization



Gama correction

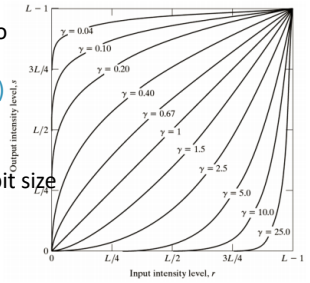
- The general form of power-law transformation is:

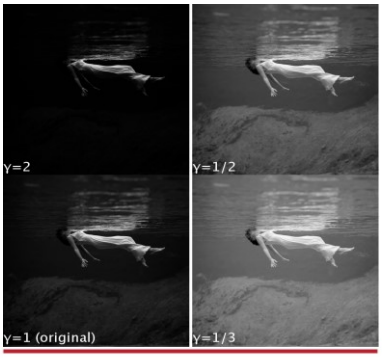
$$s = c.r^{\gamma}$$

  - $\gamma > 1$: compress values in dark area, while expanding values in light area
  - $\gamma < 1$: expand values in dark area, while compressing values in light area

r : normalized values to [0, 1]
(r = old intensity/(L-1))

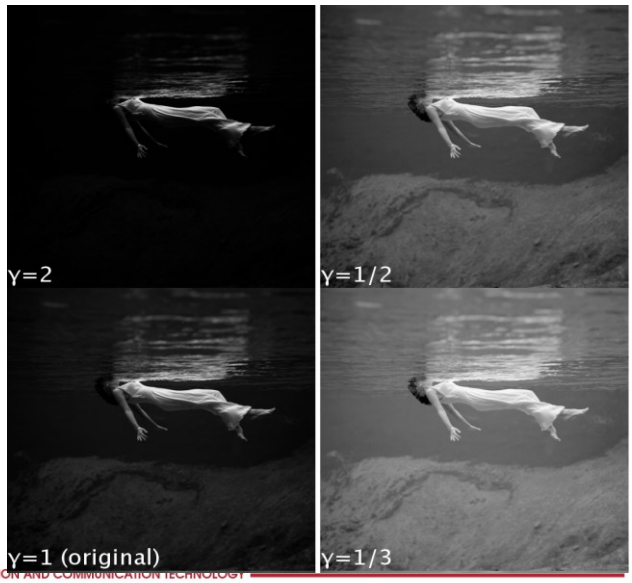
c : scaling constant corresponding to the bit size used
(c = L-1 = 255)





Gama correction

$$s = 255.\left(\frac{r}{255}\right)^{\gamma}$$



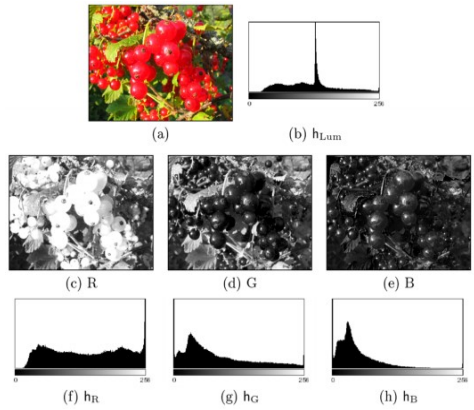
Color Image histogram

- Intensity histogram:
  - Convert color image to grayscale

  => Compute histogram of gray scale image
- Individual Color Channel Histograms:

  3 histograms for (R,G,B)
- 3D histogram:

a color identified by 3 values. Not usually because of big elements

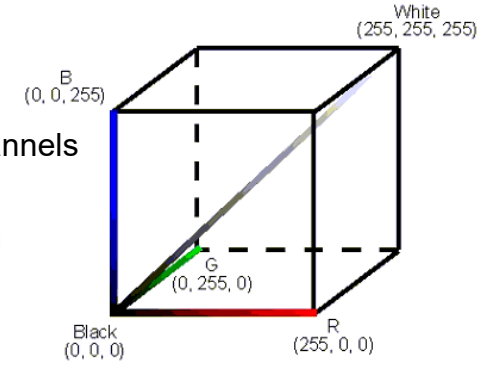


Source: https://web.cs.wpi.edu/~emmanuel

RGB (Red – Green - Blue)

- Used in storage and display
- R = G = B: gray level
- Any color

  = r*R + g*G + b*B
  - Strongly correlated channels
  - Non-perceptual
  - No separation between intensity and color

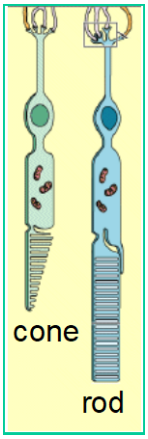


Human Vision

- Two types of light-sensitive receptors

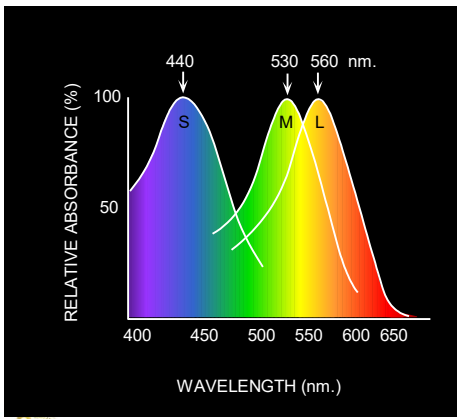
Cones
- cone-shaped
- less sensitive
- operate in high light
- color vision

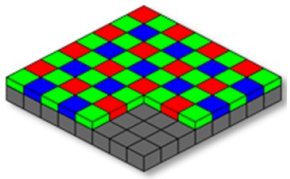
Rods
- rod-shaped
- highly sensitive
- operate at night
- gray-scale vision



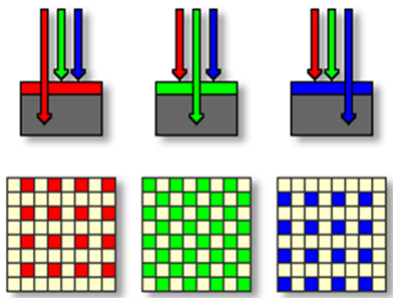
Human Vision ➔ Camera

- Three kinds of cones



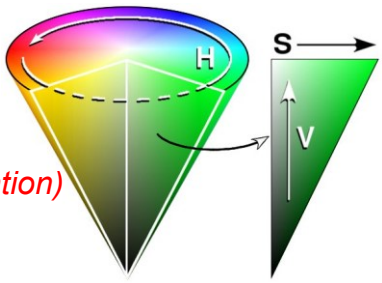


Capteur photosensible
recouvert d'une grille de Bayer



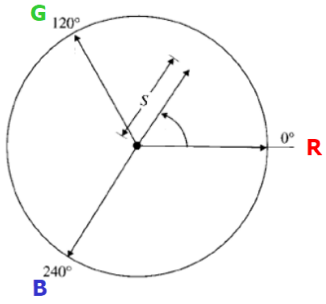
HSV (Hue – Saturation- Value)

- The Hue-Saturation-Value (HSV) color space is use for segmentation and recognition
  - Non-linear conversion
  - Visual representation of colors
- We identify for a pixel:
  - The pixel *intensity (value)*
  - The pixel *color (hue + saturation)*
- RGB does not have this seperation



HSV (Hue – Saturation- Value)

- **Hue (H)** is coded as an angle between 0 and 360
- **Saturation (S)** is coded as a radius between 0 and 1
  - S = 0 : gray
  - S = 1 : pure color
- **Value (V)** = MAX (Red, Green, Blue)



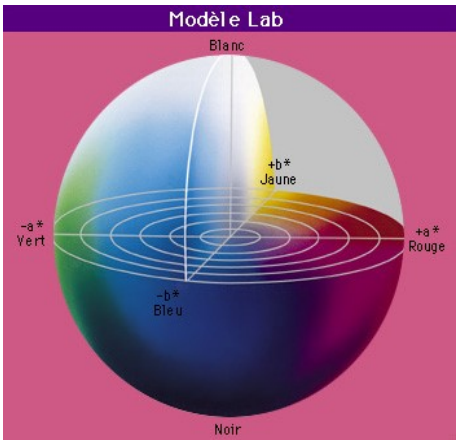
HSV (Hue – Saturation- Value)

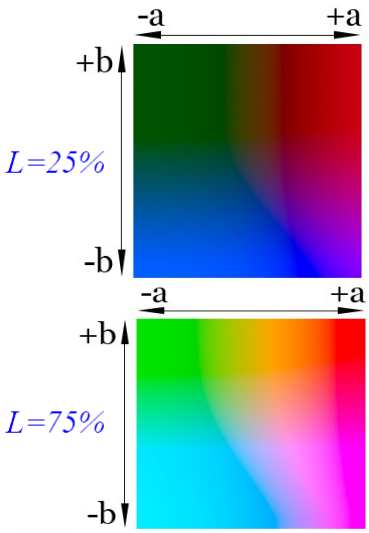
- If we know the color of the object we are looking for, can model it using a **hue interval**
- Take care, because it is an angle (periodic value)
  - Hue < 60° means nothing
    - *Is 350° smaller or bigger than 60°?*
  - Define an interval: 350° < Hue < 60° (for example)
- This interval is valid if **S**aturation > *threshold* (otherwise gray level)
- This is independant of **V**alue , which is more sensible to light conditions

Lab color space

- The **Lab** system (sometimes **L*a*b***) is based on a s from human vision
  - independant from all technologies
  - presenting colors as seen by the human eyes
- Colors are defined using 3 values
  - **L** is the luminance, going from 0% (black) to 100% (white)
  - a* represents an axis going from green (negative value, -127) to red (positive value, +127)
  - b* represents an axis going from blue (negative value, -127) to yellow (positive value,+127)

Lab color space



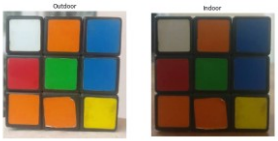


Color conversions

- Convert between color spaces
- OpenCV:
  - https://docs.opencv.org/4.0.0/de/d25/imgproc_color_conversions.html
  - Function: **cv::cvtColor** (**InputArray** src, **OutputArray** dst, int code, int dstCn=0)
    - converts an image from one color space to another
    - code: conversion code (COLOR_RGB2HSV, COLOR_RGB2HSV, COLOR_BGR2Lab, …)

Color space vs. illumination conditions

- collected 10 images of the cube under varying illumination conditions



- separately cropped every color to get 6 datasets for the 6 different colors

Changes in color due to varying Illumination conditions

- Compute the density plot: Check the distribution of a particular color say, blue or yellow in different color spaces. The density plot or the 2D Histogram gives an idea about the variations in values for a given color

Source: Vikas Gupta, Learn OpenCV

Similar illumination: very compact

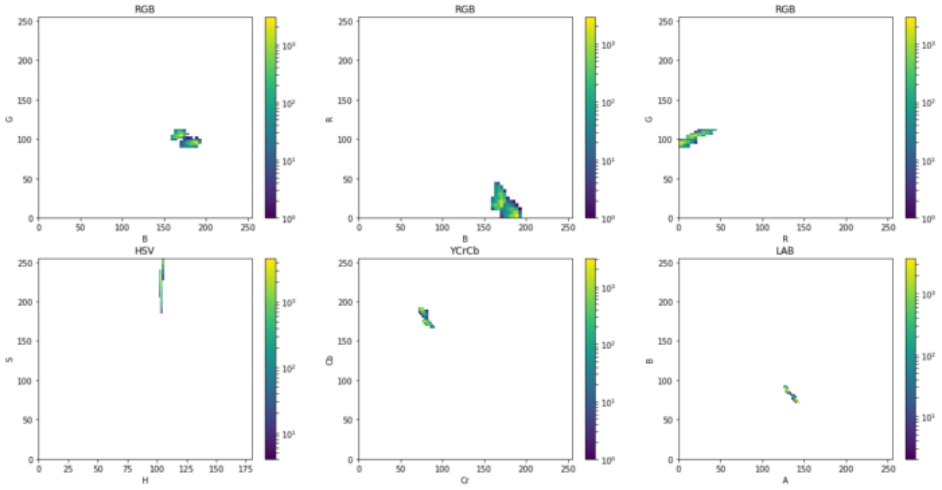


Fig.: Density Plot showing the variation of values in color channels for 2 similar bright images of **blue color**

Source: Vikas Gupta, Learn OpenCV

Similar illumination: very compact

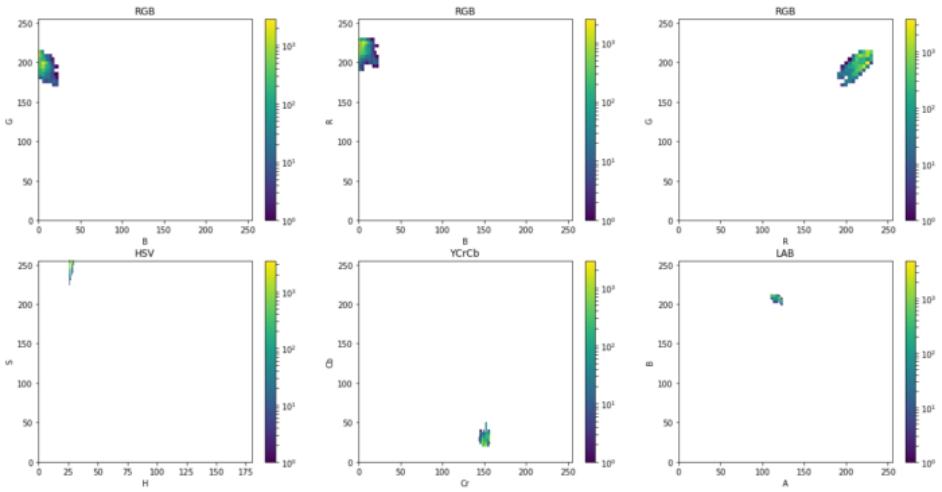

Fig.: Density Plot showing the variation of values in color channels for 2 similar bright images of **yellow color**

Source: Vikas Gupta, Learn OpenCV

Different illumination

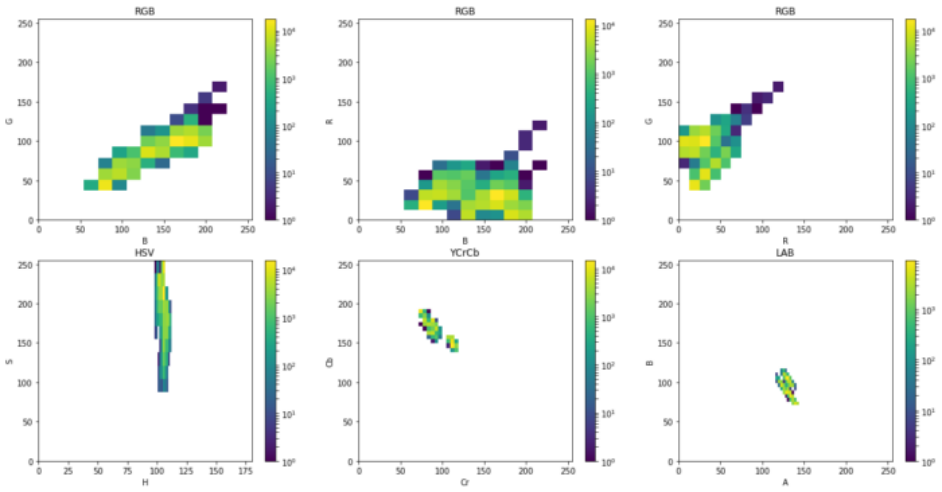

Fig.: Density Plot showing the variation of values in color channels under varying illumination for the **blue color**

Source: Vikas Gupta, Learn OpenCV

Different illumination

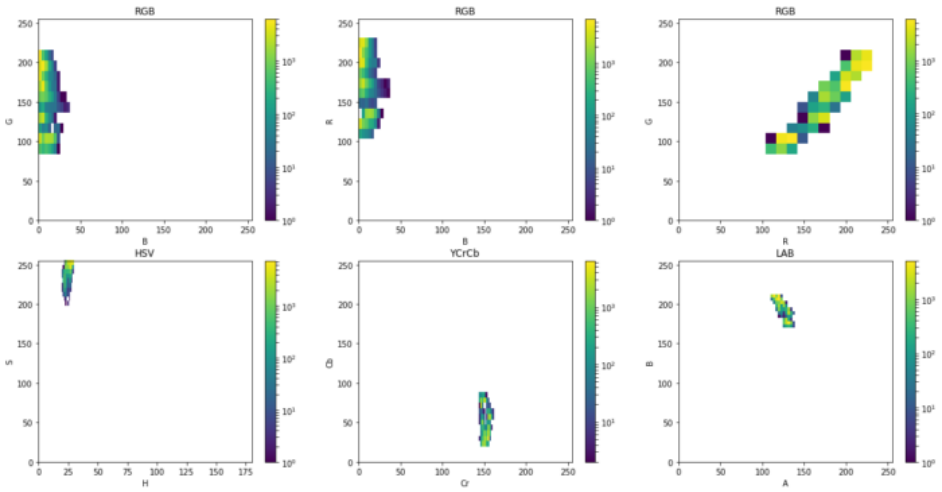

Fig.: Density Plot showing the variation of values in color channels under varying illumination for the **yellow color**

Source: Vikas Gupta, Learn OpenCV

Color space vs illumination conditions

- Different illumination:
  - RGB space: the variation in the value of channels is very hight
  - HSV: compact in **H**. Only H contains information about the absolute color ➔ a choix
  - YCrCb, LAB: compact in CrCb and in **AB**
    - Higher level of compactness is in LAB
  - Convert to other color spaces (OpenCV):
    - cvtColor(bgr, ycb, COLOR_BGR2YCrCb);
    - cvtColor(bgr, hsv, COLOR_BGR2HSV);
    - cvtColor(bgr, lab, COLOR_BGR2Lab);

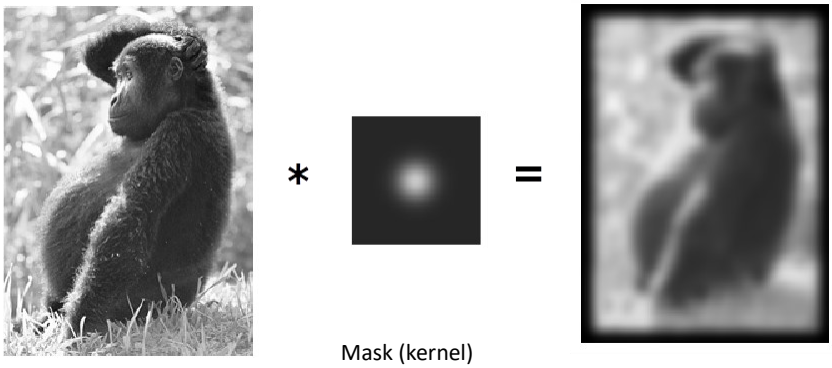
Spatial convolution

- Image filtering : For each pixel, compute function of local neighbo and output a new value
  - **Same function** applied at each position
  - Output and input image are typically **the same size**
- Convolution : Linear filtering, function is a weighted sum/difference of pixel values

$$I' = I * K$$

- Really important!
  - Enhance images: Denoise, smooth, increase contrast, etc.
  - Extract information from images:
    - Texture, edges, distinctive points, etc.
  - Detect patterns
    - Template matching

Spatial convolution



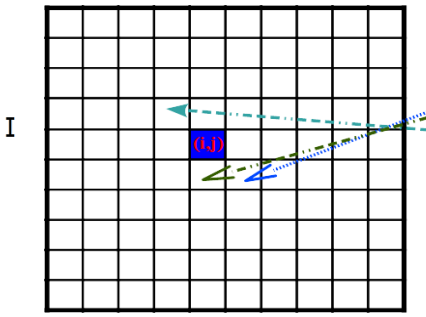
Original image

Mask (kernel)

Filtered image

Spatial convolution

- New value of a pixel(i,j) is a weighted sum of its neigbors



K: convolution kernel, mask, filter, …

- **Flip** the kernel both horizontally and vertically (filter rotated 180 degrees).
- **Put the center** of kernel at each pixel (i,j) of the image.
- **Multiply** each element of the kernel with its corresponding element of the image matrix
- **Sum up** all product outputs

$$I'(i,j) = \sum_{u=-(L-1)/2}^{(L-1)/2} \sum_{v=-(L-1)/2}^{(L-1)/2} I(i-u, j-v)\, K(u,v)$$

Spatial convolution

- New value of a pixel(i,j) is a weighted sum of its neigbors

Some kernels

- 2D spatial convolution
  - is mostly used in image processing for feature extraction
  - And is also the core block of Convolutional Neural Networks (CNNs)
- Each kernel has its own effect and is useful for a specific task such as
  - blurring (noise removing): mean filter, gaussian filter, …
  - Sharpening,
  - edge detection: sobel, prewitt, laplace
  - …..

Some kernels

Some kernels

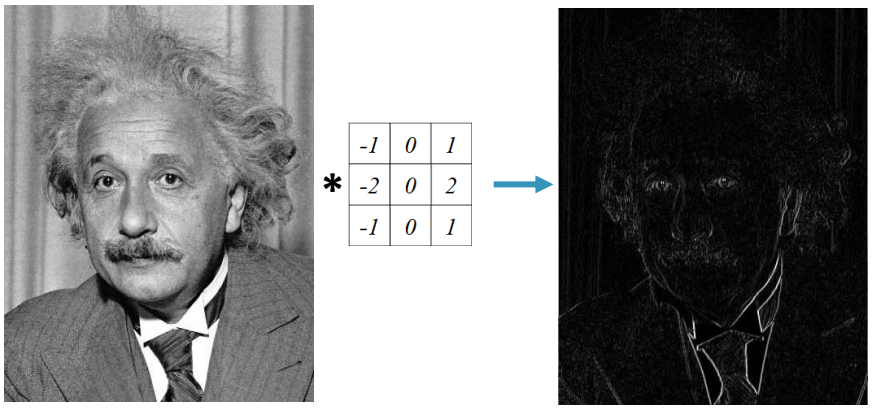
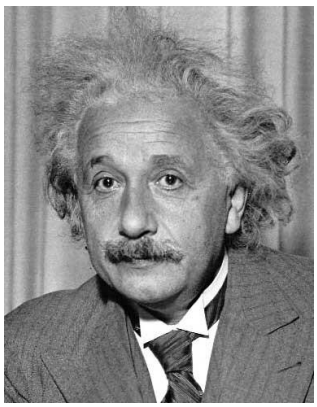
- Sobel



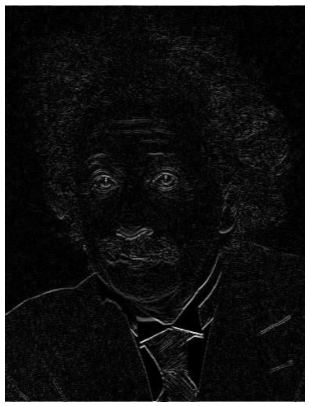
Vertical Edge
(absolute value)

Some kernels

- Sobel



$$*\begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

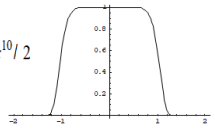


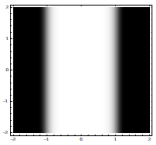
Horizontal Edge
(absolute value)

Edge detection

- Edges are corresponding to:
  - Maximums of the first derivative
  - Zero-crossing in the second derivative

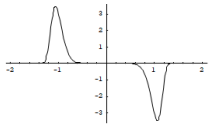
$$f(x,y) = e^{-x^{10}/2}$$

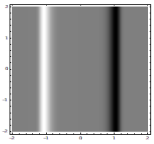




Image

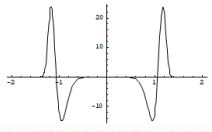
$$\frac{\partial f}{\partial x}$$

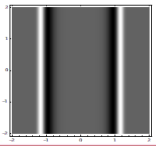




First derivative

$$\frac{\partial^2 f}{\partial x^2}$$





Second derivative

Edge detection with first derivatives

- Compute the convolution between the image and the first derivatives kernels
  - Kernels: **Sobel, Prewitt, Robert**
  - Implemented in **OpenCV library**
- Find local extrema
  - Edge composed of pixels having **maximum/minimum value of the first derivatives** of image
  - Can **use a threshold** to detect edge rapidly
  - Can make several steps to obtain the optimal edge: **Canny detector** (implemented in OpenCV)

Edge detection with first derivatives

- Filters used **to compute the first derivatives** of image
  - Robert

Edge detection with first derivatives

Image 1D f(x)

1st derivative f'(x)

|f'(x)|

Edge pixels:
|f'(x)| > Threshold

Image derivatives

- 1st derivatives :

$I *$ $\begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$ → I_x First derivative of image with respect to x

$I *$ $\begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$ → I_y First derivative of image with respect to y

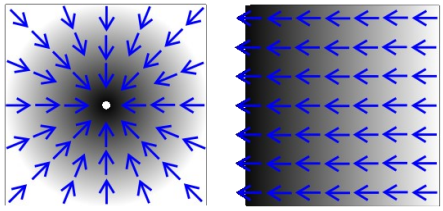
→ Image gradient

Image gradient

- An image gradient is a directional change in the intensity or color in an image
- For each pixel in the image: Gx, Gy

➔Form a gradient vector (Gx, Gy) :

- **Important information** to describe the image content
- Gradient Magnitude = $\sqrt{(Gx)^2 + (Gy)^2} \approx |Gx| + |Gy|$
- Gradient Direction = arctan(Gy/Gx)



Blue lines represent the gradient direction: from brightest to darkest

Edge detection with second derivatives

- Compute the second derivative
  - Apply the **Laplacian filter** on the image I

$$\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix} \quad \text{Or} \quad \begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

- Find zero-crossing

Laplacian filter - Second derivative

- Discrete approximations for the Laplacian function
  - One convolution matrix $\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix}$ $\begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix}$

Gradient

  - cv.Canny()

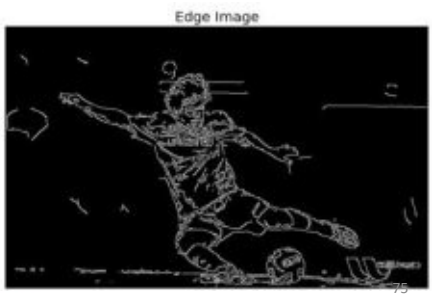

Image representation

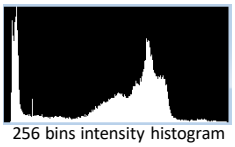
Feature extraction

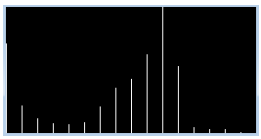
- Two types of features are extracted from the image:
  - local and global features (descriptors)
- **Global features**
  - Describe the image as a whole to the generalize the entire object
  - Include contour representations, shape descriptors, and texture features
  - Examples: Invariant Moments (Hu, Zernike), Histogram Oriented Gradients (HOG), PHOG, and Co-HOG,...
- **Local feature**:
  - the local features describe the image patches (key points in the image) of an object
  - represents the texture/color in an image patch
  - Examples: SIFT, SURF, LBP, BRISK, MSER and FREAK, …

Feature extraction

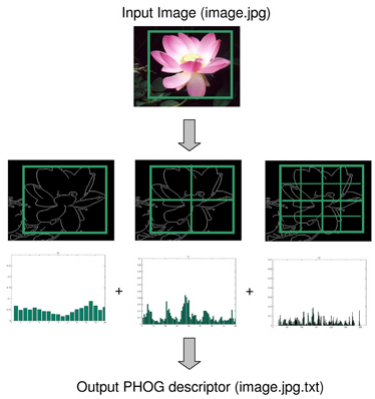
- Global features



256 bins intensity histogram



16 bins intensity histogram



Pyramid Histogram of Oriented Gradients

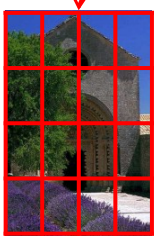
Feature extraction

- Local features: how to determine image patches / local regions

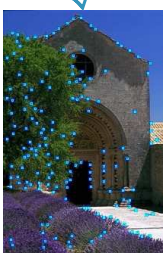
Dividing into patches with regular grid

Keypoint detection

Image segmentation



Without knowledge about image content



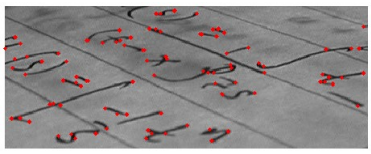
Based on the content of image

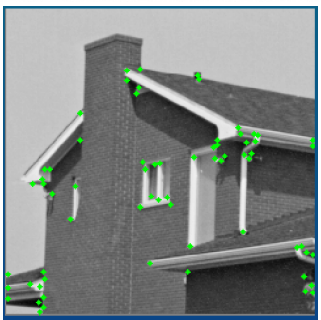
Feature extraction

- Image segmentation
  - Thresholding
  - Split and merge
  - Region growing
  - Watershed
  - …

Feature extraction

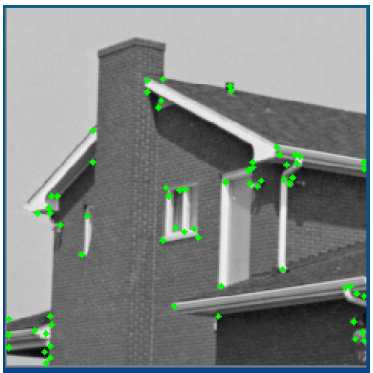
- Keypoint detectors:
  - **DoG /SIFT detector**
  - **Harris corner detector**
  - Moravec
  - …
- Local features: computed in local regions associated to each keypoints:
  - **SIFT**,
  - SURF(Speeded Up Robust Features),
  - PCA-SIFT
  - LBP, BRISK, MSER and FREAK, …





Keypoint detector

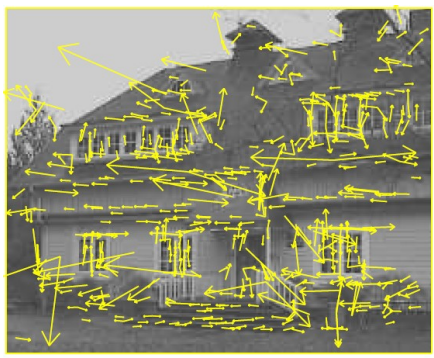
- Harris corner detector
  - https://docs.opencv.org/3.4/dc/d0d/tutorial_py_features_harris.html
  - Invariant under translation, rotation, but not scaling
- Harris-Laplace detector:
  - https://docs.opencv.org/4.0.1/d1/dad/classcv_1_1xfeatures2d_1_1HarrisLaplaceFeatureDetector.html
  - Invariant under translation, rotation, scaling



Harris $\alpha = 0.2$

Keypoint detector: DoG/SIFT detector

- Find local extrema in space-scale DoG:
  - DoG ~ Laplace of Gaussian
  - extrema in second derivatives



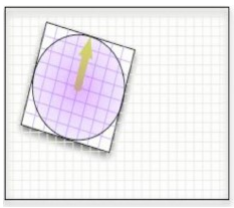
A SIFT keypoint : {x, y, scale, dominant orientation}

Source: Distinctive Image Features from Scale-Invariant Keypoints – IJCV 2004

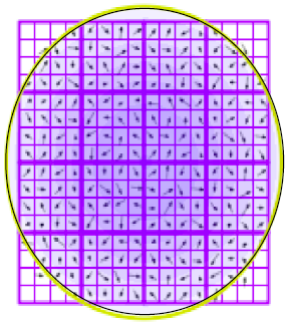
Feature extraction : Good feature?

- Compact
- Invariant to
  - geometric transformation
  - Camera viewpoint
  - Lighting condition
- Best performant local feature: **SIFT** (David Lowe)

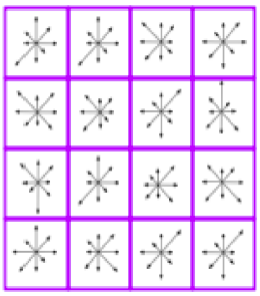
Feature extraction : SIFT feature



Blur the image using the scale of the keypoint (scale invariance)



Compute gradients in respect to the keypoint orientation(rotation invariance)



Compute orientation histogram in 8 directions over 4x4 sample regions ➔ 128 D

http://www.cse.iitm.ac.in/~vplab/courses/CV_DIP/PDF/Feature_Detectors_and_Descriptors.pdf

Feature extraction : OpenCV

- SIFT & SURF:
  - Patented algorithms
  - They are free to use fro academic / research purposes
  - You should technically be **getting permission** to use them in **commercial** applications
- From OpenCV 3.0, patented algorithms are
  - removed from standard package,
  - putted into non-free module (opencv-contrib, not installed by default). From version 4.4, sift is free (in the standard package)
- Free alternatives to sift, surf:
  - ORB (Oriented FAST and Rotated Brief)
  - BRIEF, BRISK, FREAK, KAZE and AKAZE

Feature extraction : OpenCV

- SIFT

  sift = cv.xfeatures2d.SIFT_create() // for version before v 4.4.

  sift = cv. SIFT_create() // for version from v 4.4.

  – **sift.detect()** function finds the keypoint in the images

  – **sift.compute()** which computes the descriptors from the keypoints

  kp = sift.detect(gray,None)

  kp,des = sift.compute(gray,kp)

  – Find keypoints and descriptors in a single step **sift.detectAndCompute()**

  kp, des = sift.detectAndCompute(gray,None)

  – https://docs.opencv.org/3.4/da/df5/tutorial_py_sift_intro.html

- SURF: similar

Feature extraction : OpenCV

- SURF: similar

```
>>> img = cv.imread('fly.png',0)
# Create SURF object. You can specify params here or later.
# Here I set Hessian Threshold to 400
>>> surf = cv.xfeatures2d.SURF_create(400)
# Find keypoints and descriptors directly
>>> kp, des = surf.detectAndCompute(img,None)
>>> len(kp)
699
```

Origine: Bag-of-words models

- Orderless document representation: frequencies of words from a dictionary Salton & McGill (1983)

US Presidential Speeches Tag Cloud
`http://chir.ag/phernalia/preztags/`

Bags of features for object recognition

- Works pretty well for image-level classification and for recognizing object *instances*

face, flowers, building

Bag of features: outline

1. Extract features
2. Learn “visual vocabulary”
3. Quantize features using visual vocabulary
4. Represent images by frequencies of “visual words”

OpenCV:
BOWImgDescriptorExtractor Class

Higher semantic vision problem

1. Image representation
   - Pixel level
   - Region level
   - Image level

2. Classification: ML techniques
   - Pixel level ➔ segmentation
   - Region level ➔ detection
   - Image level ➔ classification/recognition
